Mr. Steven Webb
Los Angeles Regional Water Quality Control Board
Senior Water Resource Control Engineer
320 W 4th Street, Suite 200
Los Angeles, CA 90013

Dear Mr. Webb,

As you are aware, Camrosa currently operates the Camrosa Water Reclamation Facility (CWRf) under Waste Discharge Order# 2019-0118 and reclaims 100% of its effluent. We put the effluent to beneficial use in agricultural applications as well as for landscape irrigation at the Cal State University Channel Islands campus and have done so since the modern plant began operation in 1997.

In the past a NPDES permit was required if, during severe storms, we were not able to discharge all the effluent for reuse. In that case, we would have to discharge to the local creek under a NPDES permit. We did discharge to the creek in January 2005 for 3 weeks during severe storm events. This was the last and only discharge to the creek.

Today there exists a wider variety of places to hold and/or discharge CWRf effluent:

- The CWRf now can discharge excess plant effluent to the Calleguas Salinity Management Pipeline (Brine Line).
- There are approximately 26 million gallons of offsite effluent storage capacity between Ponds #1 and #4. Holding pond #1 which feeds our direct recycled water users as well as holding pond #4 which feeds Pleasant Valley County Water District, a permitted recycled water customer that provides agricultural water to parcels on the Oxnard plain. Between the two ponds, we have approximately 20 days of emergency storage. We can also transfer effluent from holding pond #1 to holding pond #4 if our direct users cannot take all the effluent themselves.

An ongoing policy of raising manhole covers when necessary and repairing other sources of sewer infiltration has resulted in markedly reduced excess flows to the CWRf during rain events.

In the event that the CWRf has effluent in excess of demand, attempts will be made to hold the effluent and put it to beneficial use. Discharge to the brine line will be used a last resort.

With the various discharge options now available to us besides the creek, we will no longer require a NPDES permit and so, the Camrosa Water District would like to formally request the discontinuance of NPDES Permit #2020-0078.

If you have any questions or comments, please contact me at (805) 248-0402 or at mphelps@camrosa.com

Warmest Regards,

Michael Phelps
